

Vaccinating Against Brain Syndromes: The Campaign Against Measles and Rubella (Monographs in Epidemiology and Biostatistics)

In this book, the public health experts who lead the campaign against measles and rubella discuss the epidemiology of these diseases, their deleterious effect on the brain, and the development of vaccines to control their spread. After evaluating the various immunization policies, programs, and strategies developed in the United States, the book considers how global eradication of these two viruses might be approached.
